### **Understanding Methadone and Its Medical Use**

Methadone is a prescription medication widely used in **medication-assisted treatment (MAT)** programs for opioid use disorder. It can also be prescribed to manage severe, long-lasting pain when other treatments are not effective.

Doctors prescribe methadone because it:

- Helps reduce opioid withdrawal symptoms
- Stabilizes patients during addiction recovery programs

- Provides long-acting pain relief when monitored properly
- Supports structured treatment plans with medical supervision

Because it is a **controlled medication**, methadone must always be prescribed by a licensed medical professional and dispensed through authorized pharmacies. Any service claiming to provide it without proper verification should be avoided.
